BAC clone F2847 is from Arabidopsis chromosome III and is near the
molecular marker ILRN:
The orientation of the sequence is from SP6 to 77 end of the BAC
                                                                                                                                                                                    ó

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.orn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://www.cbs.dtudk/netpgene/Cbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity to other proteins are named similarity but with EST similarity, that are predicted by more annotated as 'hypothetical' proteins. Genes without protein or EST similarity, that are predicted by more annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (seas EdV). Simple repeats are identified by repeatmasker (Arian Smit, Pervin) Paring of identified by repeatmasker (Arian Smit, Pervin) Paring of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRAIL are annotated as misc features.

Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with ESF similarity are named as 'unknown' proteins. Genes without protein or ESF similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy. http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/RepeatMasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /translation="MGISFSIPFDPCVNKVSQWLDMKVSYTHNLEKNLAALEKTMKEL

The cDNA library to be analyzed within the framework of this project was created using a Borrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of 1202 bp in length

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are intelly to encode antigens have been identified and these polypeptides can be obtained. Specifically, sequences which are be used in a vaccine composition against S.aureus in a sample. S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, ostcomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypetides. The new DNA sequences can be used cand their fragments) are useful as primers or probes for isolating the production of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               41 aattgotcaactaggacctgaactggcaactactcttgtaattgtcatttctaagagcgg 100

A computer readable medium has been developed which has recorded on it $1298 nucleotide sequences isolated from the Enterococcus faecalis genome. $12938 to $1399 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system commercial importance. The products can be used to detect the presence diagnosing Enterococcus faecalis in samples. They can also be used for products can be used to detect the presence diagnosing Enterococcul infection in an animal and monitoring progression of disease, and for identifying agents which can be used to another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal

The present sequence represents a claimed polynucleotide coding for the phosphatidylglycerophosphate synthase (pgsA, see Y31662) of staphylococcus aureus WGCH29 (NCIMB 40771). The gene can be isolated from chromosomal DNA of WGUH29 using a hybridisation proble. The invention provides pgsA polynucleotides and antagonists. The polypeptides can be administered therapeutically, especially by expressing encoding polynucleotides, to treat an individual in need of pgsA polypeptide (claimed). Polynucleotides and can can be used to produce probes for detecting or isolating sequences useful for recombinant production of pgsA polypeptides, and can also be used to produce probes for detecting or isolating sequences relating pgsA or similar sequences e.g. to diagnose diseases relating to polypeptide expression or activity (claimed) and to for gene mapping. Computer readable forms of the present sequence may be used to perform homology identification, by comparing the sequence with at least one polynucleotide/polypeptide sequence to sequence and a second polynucleotide sequence (claimed). The computer and a second polynucleotide sequence (claimed) or a least one overlapping region between the present sequence and a second polynucleotide sequence (claimed). The polynucleotides can mammal is incoulated with a nucleic acid vector dispersion of the nucleic acid vector dispersion of the nucleic acid vector dispersion of the nucleic acid vector dispersion of the nucleic acid vector dispersion of the near an immunological disperiment in vivo avarragation of the near and nucleic acid vector dispersion of the near and a second polynucleotide sequence.

A compute reduction has been considered from the Enterococcus faccalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as configs. The computer-based system commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcual infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcus!

```
The present sequence encodes a protein from Streptococcus pneumoniae.
The nucleic acid sequence encoding the Streptococcus pneumoniae protein
Streptococcus pneumoniae, for inducing protective antibodies against
Streptococcus pneumoniae, for treatment or prevention of infection e.g.
The nucleic acid sequence encoding protective antibodies against
The streptococcus infection (by usual hybridisation or are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or antibodies in standard immunoassays, especially for diagnosing or antibodies in standard immunoassays, to purify the protein and for passive detect corresponding antigans, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000

Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus oneumoniae

Claim 1; Page 332-339; 1409pp; English

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V22134 to V55524) recorded to nit, or a representative fragment or a sequence at least 95% identical to SED ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus collecule encoding a homologue of any of the fragments of the S. pneumoniae of pneumoniae are present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S. pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising: (b) screening a genomic DNA library using a process comprising of the library which contain sequences to 391, identifying members of the library which contain sequences from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the computer-based system for identifying fragments of the solution encounter of the sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome or computers from the present convention can be never invention can be neved in a computer-based system for identifying fragments of the subminiar genome or commercial importance, or expression modulating invention can be neved in diagraphy to the second or expression modulating invention can be neved in diagraphy to the second organizating the amplification primer according to the second organizating the amplification when the present invention can be neved in diagraphy and second organizating the amplification in the present invention can be neved to the second organizating the second organizating the second organizating the second organizating the second organizating the second organizating the second or used in diagnosis kits and assays, and pharmaceutical vaccines for S. pneumoniae. compositions and

of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or requilatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used
                               the sequence listing in the specification. They are included to maintain the nucleotide numbering given in the specification for this DNA sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents one of 5191 Staphylococcus aureus DNA sequences

The present sequence encodes human FLICE-like inhibitory protein short form, designated FLIP-S. The present invention describes a new treatment of a condition characterised by vascular wall inflammation in a subject comprising administering a FLIP molecule to inhibit Fas ligand-mediated apoptosis of vascular endothelial cells in the subject. The method can be used to treat atherosclerosis, transplant arteriosclerosis and

```
The present sequence represents DNA coding for MACH-related inducer CO f toxicity (MRIT) isoform MRIT beta 1 (see Y05789), a CED-4 homologue that has pro-apoptotic activity. An EST sequence having chomology to the p20 domain of human ICB-like protease MACHJ/FLICE was isolated from an EST database. Several overlapping EST clones were sequenced to deduce the sequence of the full-length MRIT alpha 1 clone (see X25508) and 2 isoforms, alpha 2 (see X25509) and beta 1. The MRIT gene was localised to the human chromosome 2q32.33 cepton. MRIT alpha 1. Selective enhancers and inhibitors of MRIT appa 1. Selective enhancers and inhibitors of MRIT appa 1. Selective enhancers and inhibitors of MRIT appatal. Selective of programmed cell death or proliferation. In addition, nucleic acid molecules encoding proliferation. In addition, nucleic acid molecules encoding programmed cell death. A cell accumulation disorder such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         selectively enhances MRIT apoptotic activity, thereby inducing apoptosis in a subject. A disorder of cell loss, such as a neurodegenerative disorder, including Alzheimer's disease, Parkinson's disease, retinitis pigmentosa, stroke, aplastic anaemia, myocardial infarction or AIDS can be treated by administering an agent that selectively inhibits MRIT apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer, autoimmune disease, viral infection, angiogenesis and atherosclerosis is treated by administering an agent that

this cups a seqence coues for the beta isolaid (incord) man of 1 protein. It was isolated from a human skin fibroblast connected and a longer isolated from a human skin fibroblast connected and a longer isoform, G1-alpha (see WA8903), represent 2 splice and a longer isoform, G1-alpha (see WA8903), represent 2 splice cand a longer isoform, G1-alpha (see WA8903), represent 2 splice and a longer isoform, G1-alpha (see WA8903), represent 2 splice converted the G1 protein. These G1 proteins are capable of casp-8), and thereby of binding to the intracellular domain of the p55 tumour necrosis factor (TMF) intracellular domain of the p55 tumour necrosis factor (TMF) creceptor, to which MORT-1 binds, or of binding to the creceptor, to which PRADD binds and to which TRADD protein MORT-1 binds, they are considered as mediators or modulators of py the binding of FAS ligand to FAS-R, and also having a role in e.g. the signalling process that is initiated by the binding of TMF to p55-R.

C5 FAS-R having a role in e.g. the signalling process that is initiated by the binding of TMF to p55-R.

C6 I DNA (1) and polypeptide (II), vectors and fragments are used to regulate cell death, and its inhibitors augment, end and the simplificors and a specific cell scarrying an FAS-R or p55-R. Tumour, HIV-infected or other considerated using a viral vector encoding (II), which binds a specific cell surface protein, which binds a specific cell. Surface protein, which binds a specific cell. Surface ceptor, blook the capuated using a vector encoding a ribozyme of fetted son also be regulated using a vector encoding a ribozyme that interacts with a cellular mRNA encoding (II), and allows (II) expression of (II) and can also regulate the above effects. This cDNA segence codes for the beta isoform (see W78904) of novel New DNA encoding isoforms of G1 protein which bind MORT-1 - and regulate the effects of FAS and tumour necrosis factor receptors, useful for killing of cells e.g. HIV and cancer cells Goltsev Y, Kovalenko A, Varfolomeev E; Claim 4; Fig 2; 132pp; English.

The polypeptide amino peptidase (IRAP) polypeptide, and is a regulator of insulin-responsive translocation of glucose transporter, GUDT4. The polypeptide is useful in treating disorders associated with aberrant activity or expression of IRAP-BP by administration of IRAP-BP modulators. Disorders associated with insulin resistance or diabetes. The protein is also useful for the treatment of respiratory disorders e.g. asthma and as immunogens for

 producing anti-IRAP-BP antibodies, to purify IRAP-BP ligands and in screening assays to identify molecules which inhibit the interaction of IRAP-BP with an IRAP-BP ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This cDNA sequence codes for human FLAME-1 (see W90107), or FADD-like apoptotic/anti-apoptotic molecule 1. FLAME-1 is a novel anti-apoptotic protein that interacts specifically with FADD, McD4, McD5 and FLAME-2. It is recruited to the Fas receptor complex and Ras/TNF-induced apoptosis upon expression in FaS/TNF-induced apoptosis upon expression in can abrogate Fas/TNF-induced apoptosis upon expression in chromosome 2933-34. The full-length FLAME-1 cDNA was isolated from a Jurkat cDNA library using a partial FLAME-1 cDNA probe that had itself been generated from the Jurkat library using primers (see 184139-42) based on an isolated EST tlone. Host cells, recombinant ectors, and methods of using FLAME-1 to identify substrates, activators or inhibitors of FLAME-1 are provided. FLAME-1,

FLAME-2 (see W90108) and agonists can be used to inhibit apoptosis, e.g. for treating HIV infection or Alzheimer's disease. Inhibitors of the polypeptides can be used as apoptotic agents. FLAME nucleic acid molecules can be used for gene therapy, e.g. antisense oligonucleotides can be used in vivo for antineoplastic purposes.

coverlapping EST clones were sequenced to deduce the sequence of the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see X25510). The MRIT gene was localised to the human chromosome 2432-33 region. MRIT alpha 1 includes an N-terminal death effector domain and a C-terminal caspase homology commin, but is not a cysteine protease. Selective enhancers and inhibitors of MRIT appottotic activity can be identified and used to treat diseases mediated by the dysfunction of programmed cell death or proliferation. In addition, nucleic acid molecules encoding pro-appotentic isoforms of MRIT can also be used as inducers of programmed cell death. A cell accumulation disorder such as cancer, autoimmune disease, viral infection, angiogenesis and anterosciencosis is treated by administering an agent that selectively enhances MRIT apoptotic activity, thereby inducing apoptosis in a subject. A disorder of cell loss, such as a neurodegenerative disorder, including Alzheimer's disease, retinitis pigmentosa, stroke, aplastic anamia, myocardial infarction or ALDS can be treated by
